

VIRA Incident Report

Log File: nothing.csv

Threat Summary

The security logs indicate two separate events that may be related to a potential security incident.

- A failed login attempt was detected from IP address 192.168.1.100 on July 16, 2026.
- Malware was detected on IP address 10.0.0.5 on the same day.

Risk Score

Based on the severity of the events, I would categorize this incident as a High Risk.

MITRE ATT&CK;

MITRE ATT&CK;

- T1568.001: Malware is executed (Malware Detected)
- T1133: Invalid login (Failed Login)

However, without further context or investigation, it's difficult to determine the exact tactics, techniques, and procedures (TTPs) used by the attacker.

Recommendations

1. Investigate the Source IP: Immediately investigate the source of the failed login attempt from 192.168.1.100 to identify potential vulnerabilities in the authentication process.
2. Contain Malware: Contain the malware detected on 10.0.0.5 by isolating the affected system and preventing further spread.
3. Monitor Network Traffic: Monitor network traffic for any suspicious activity related to the affected systems.
4. Review User Accounts: Review user accounts to ensure that all access is authorized and that no unauthorized users have gained access to the network.
5. Update Security Measures: Update security measures, such as firewalls and intrusion detection/prevention systems (IDPS/IPS), to prevent similar incidents in the future.

It's essential to perform a thorough investigation and gather more information about the incident before taking any further actions.
